# **IHDEDENTAL**?

# THE ADVANTAGES

OF THE ENDOSSEOUS DENTAL IMPLANT SYSTEM ROOT®

KOS **ROOT**® implants are used for crowns, bridges and bars. The compression screw design permits to incorporate the restoration in an immediate loading protocol (incorporation of the prosthesis within max. three days). The single-piece design reduces costs, the danger of periimplantitis and it eliminates the hazzles of screw loosening. KOS **ROOT**® implants are straight with prosthetic head for cementation.

The prescribed or recommended tightening torques for implants can be found on our website:

www.implant.com/en/downloads

Immediate loading protocol

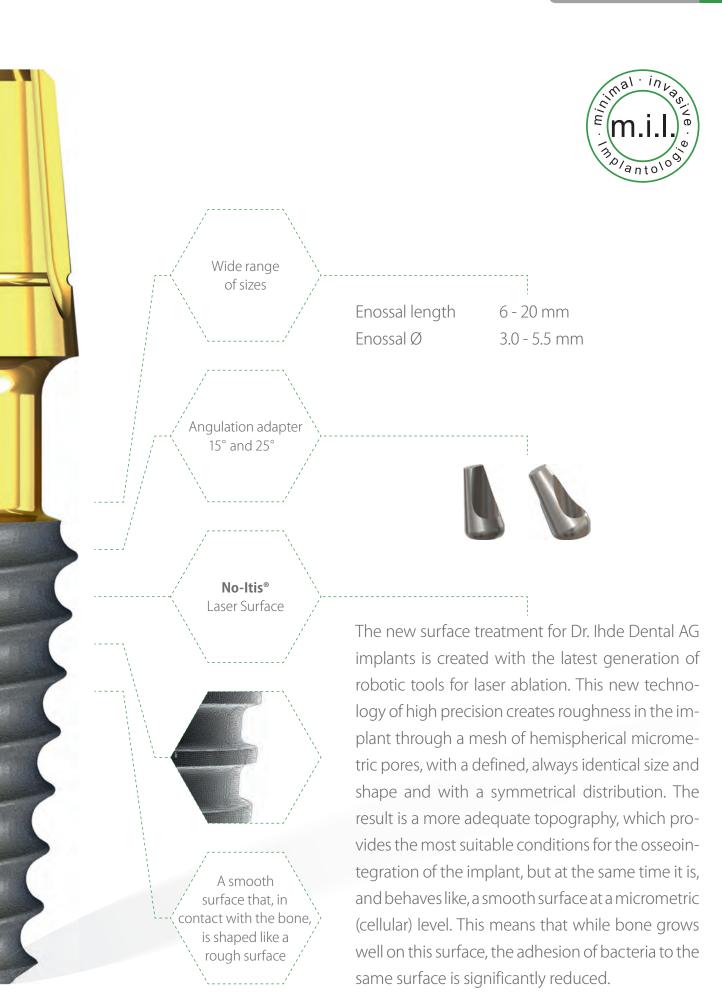

Very few working steps

Compression thread

Made of highly resistant titanium alloy

Smart instrument tray

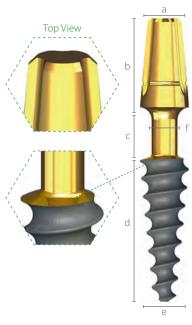

# KOS ROOT® IMPLANTS

Neck Ø 2.0 mm:

a) Abutment Ø	3.9 mm
b) Abutment height	7.2 mm
c) Neck length	3.7 mm
d) Enossal length	6 - 20 mm
e) Enossal Ø	3.0 - 5.5 mm
f) Neck Ø	2.0 - 2.55 mm
KOS ROOT® 3.0 - 4.0	Max. insertion torque 50 Ncm
KOS <b>ROOT® 4.5 - 5.5</b>	Max. insertion torque 80 Ncm

KOS **ROOT**® implants are delivered incl. lab-set REF 462353, consisting

Double analogue, plastic

IA4/IAU 462111

Impression post castable, engages in the three vertical notches PA X 462136

Impression post castable, internally round

TSPA 4 462029

**NOTE TSPA 4** is part of the standard lab-set, but CAN NOT be used for KOS **ROOT®. TSPA 4** can only be used on implants with a small abutment head, which can be found in the KOS® system application (REF 6656).

#### **ADDITIONAL IMPRESSION TAKING AND LABORATORY ACCESSORIES**

# **CEMENTABLE ANGULATION ADAPTER** (TI6AL4V)

These adapters are mounted on KOS **ROOT®** implants to compensate for the insertion direction. Plastic cements are preferably used. The implant head must be roughened beforehand. The protruding head parts are then removed. The impression is taken directly on the adapter.

Price cat.

C

#### **INSERTION TOOLS**

#### **HEATLESS® DRILLS**

Surgical steel, colour-coded, depth-coded and autoclaveable. The drill is marked with laser depth markings. Use between 3,000 and 5,000 rpm with good cooling and intermittent drill technique. Due to the extremely high cutting performance, you can work without pressure.

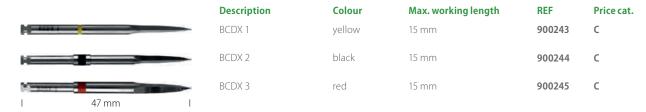

#### DRILLS MUST BE CHOOSEN DEPENDING ON BONE QUALITY AND IMPLANT DIAMETER.

	Description	Colour	Max. working length	REF	Price cat.
0081	DOS 1	yellow	17 mm	455311	D
0083	DOS 2	black	17 mm	455312	D
pus s	DOS 3	red	17 mm	455313	D
0001	DOS 4	blue	21 mm	455314	D
0.055	DOS 5	green	17 mm	455315	D
	DOS 6	transparent	15 mm	455316	D

**DOS 6** This drill is 2 mm shorter at the tip. It can therefore drill up to 2 mm deeper into hard bone than nominally indicated on the drill. Therefore, the conical bone cavity is only circularly extended in the crestal area without increasing the drilling depth.

#### **PATHFINDER DRILLS**

Conical 3-edge drill as initial drill, ideally suited for all crestal implant systems. The drill also passes between narrow cortical areas without pressure. For implants up to 20 mm length.

### **STARTER** TRAY

 $Autoclaveable\ up\ to\ 134°C, not\ suitable\ for\ dry\ heat\ sterilizers. This\ surgical\ kit\ contains\ all\ drills\ and\ tools\ for\ first\ works\ with\ the\ system\ KOS\ \textbf{ROOT}^\bullet. Material:\ autoclaveable\ plastic.$

# **SURGERY**

KOS ROOT® implants are used as compression screws. If possible, the hole should be created substantially thinner than the core diameter of the implant, since only in this way can good bone condensation be achieved. The minimum hole diameter depends on the bone density. For this reason, it is not possible to specify drill sequences that can be used favorably for all bone qualities. As a rule, it is necessary to drill much less into the soft maxilla (e.g. the DOS1 drill only can be used for KOS ROOT® implants with diameter 3.0-5.0) than into the well-mineralized mandible, which requires the use of a drilling sequence adjusted to the bone density. In very hard bone the implants should be inserted slighty deeper and then turned back 1/2 round.

#### 1. Handling

Hold the implant by the holder and place the insertion tool on the implant head. The endosseous implant surface must not be touched. Pull out the implant with the plug and then twist off the plug with the needle holder at the predetermined breaking point.

KOS **ROOT**® implant with insertion tool **IT2W** (for angle piece) and **IT2 BCS** (manual)

Twisting off the bracket with the needle holder

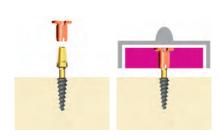

## 2. Insertion using manual tools

Insert the implant by hand until it is firmly seated in the jaw.

Using the ratchet, torque ratchet or contraangle, screw the implant clockwise into the cavity. The endosseous part of the implant must be completely covered by bone. The polished implant neck is located in the mucosa. We recommend screwing the implant into the bone up to 1 mm deeper into the implant neck.

# 3. Impression

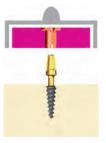

Attachment of the impression post

Pressureless impression taking

## 4. Laboratory procedures

Attachment of the impression post onto lab analogue.

Removal of the scoop from the implant. The impression post is located in the impression material. The impression can be sent to the laboratory.

IA4/IAU

The modeling is performed on the castable part POB (internally round; for bridges and bars).

Basal implants may only be used and operated by qualified persons with valid authorisation (para. 2 MedProdAnw Verordnung). We are certified according to DIN EN ISO 13485 and Annex II of Directive 93/42 EEC.

The product dimensions shown in this brochure may differ from reality for technical reasons.

KOS® is a registered trademark. Pat. Pend.

If implants are reprocessed, there is a risk of the development of infections, because no validated method for processing exists. Implants therefore may not be reprocessed.
